New "Pearl" Laser Renews Skin's Surface with Significantly Faster Results

PEARL™, a new laser procedure for treating sun damage, uneven texture, brown spots and fine lines without the downtime, risk, or repetitive treatments associated with today's other technologies, is now available from Dr Craig Layt's Clinic.

"There is no other laser like this. It's like a TCA peel with the controlled depth and full epidermal turnover" says Dr Layt. "My patients say their skin feels amazingly soft, like the new skin of a baby. With some other laser technologies, patients must wait up to six months to see the full results."

The Pearl procedure is ideal for patients of almost any age searching for a safe and uncomplicated way to restore the skin's youthful look and feel in only one or two treatments. It is the answer for patients who want quicker results and less downtime than other procedures available today.

How it works:

- During the procedure, pulses of light are gently delivered to the epidermis.
- The laser simultaneously sends heat to the

deeper layers of skin to stimulate longer-term collagen growth.

- A natural protective layer forms on the skin.
- The treated skin will look slightly sunburned.
- On day three or four the protective layer will peel away, leaving new, healthy, vibrant skin with a 'pearl-like' glow, underneath.

The Pearl laser, made by Cutera Inc, is TGA approved and is the first application of the 2,790nm laser wavelength for cosmetic dermatology. This advanced technology provides the most ideal balance between cosmetic benefit and minimal downtime. The Pearl and Pearl Fractional procedures are personally performed by Dr Layt.
